

Fork Positioners

The fork positioner is a hydraulic apparatus that allows the person driving to be able to maneuver the lift truck without leaving the seat. They are made out of high quality materials and are intended to be able to endure the most demanding procedures and work surroundings. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate much more precise lifting and placement in a faster and more efficient manner.

The only one of its kind fork pocket design enables the person operating it to be able to safely sway the unit's blades without any fear of damaging the positioning cylinders. This could allow the worker the alternative to either execute simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into blade positioners on available units.
