

Grapples

On excavators, grapples can be utilized together with the crowing operation of the bucket cylinder. They can mount directly to the jib and can be utilized when processing and handling domestic and aggregate waste materials, timber and construction materials. The grapple's boxed design has added support bridging. This manufactured design offers the grapple with utmost strength and support by way of stopping the body from breaking and rotating through its operation.

The grapple and all of its moving parts are constructed of hardened steel. The revolving points are designed in order to ensure supreme closing force and holding ability. The one operating it has the capacity to handle all sizes and varieties of supplies using the jaws fitted at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for utmost handling capacity.
